

Ugur Cihan Cekic

Full-Stack Developer — SaaS, Mobile Apps & AI-Powered Products

ugurciancekic@gmail.com · github.com/ugurcihan

HEADLINE OPTIONS (FOR THE "TITLE" FIELD ON UPWORK / FIVERR)

1. Full-Stack Developer — SaaS, Mobile Apps (iOS/Android) & AI-Powered Tools
2. Full-Stack Developer | Next.js, Flutter, iOS/Android, AI Integrations
3. I build web & mobile products end-to-end — from idea to App Store

OVERVIEW (FOR THE "PROFILE DESCRIPTION" / "ABOUT" FIELD)

I build products end to end — from a rough idea to something real people actually use. Over the past few years I've shipped a management SaaS for trade fairs, an automated code-audit agent for developers, health and mobility apps, and an iOS app live on the App Store.

I work across the whole stack myself: frontend, backend, mobile, and the less glamorous parts like QA, security, and app store compliance. I care about shipping things that work reliably, not demos that fall apart under real usage.

If you need someone who can take a product from a napkin sketch to a working, published application — web, iOS, Android, or all three — that's what I do.

WHAT I CAN HELP YOU WITH

- **Web application development** — fast, modern interfaces and full-stack apps (Next.js/React + Node.js)
- **Mobile app development** — native iOS (Swift) and Android (Kotlin), or cross-platform with Flutter
- **SaaS product development** — end-to-end: idea, design, backend, frontend, launch
- **Backend & database architecture** — Postgres, Supabase, Firebase
- **AI / LLM feature integration** — adding smart features, chat, or automation into an existing product
- **API design & integration** — REST and GraphQL
- **Code audits & automated testing** — catching bugs and quality issues before users do
- **App Store / Google Play publishing** — I've taken an app through the full Apple review process to a live release

TECHNICAL SKILLS

Languages

SKILL

WHAT IT'S FOR

 Python

General-purpose scripting, automation, data processing, and backend services

 JavaScript / TypeScript	The core language of the web — used on both frontend (React/Next.js) and backend (Node.js)
 Swift	Apple's language for building native iOS apps
 Kotlin	Google's modern language for native Android apps
 SQL	The language used to query and manage relational databases
 Bash / Shell	Scripting for automating repetitive tasks, deployments, and server operations
Mobile	
 Flutter	Google's cross-platform framework — one codebase that runs natively on both iOS and Android
 iOS (live on the App Store)	Native Apple app development — I have a published, Apple-approved app live on the store
 Android (on Google Play)	Native Android app development and publishing
Web & Backend	
 Next.js / React	The industry-standard framework for building fast, modern web apps and interfaces
 Node.js	JavaScript on the server — powers APIs and backend logic
 Supabase / Postgres	A modern backend-as-a-service built on Postgres — databases, authentication, and file storage
 Firebase	Google's app platform for real-time databases, authentication, and hosting
 REST & GraphQL APIs	The two standard ways applications exchange data — I design and build both
 Docker	Packages an application so it runs identically on any server or machine, simplifying deployment
 Vercel	A hosting platform for deploying web apps instantly with automatic scaling
Tools & Workflow	
 VS Code	My primary code editor
 Git & CI/CD	Version control, plus automated pipelines that test and deploy code safely
 Automated Testing (Playwright)	Scripts that test an application automatically to catch bugs before users do
 System Design	Planning how a product's pieces — database, backend, frontend, infrastructure — fit together before building
Security & AI	
 Auth & Security	Secure login systems, permissions, and protecting user data

 LLM Integrations	Connecting AI language models into products to power chat, automation, and smart features
 Product & UX Design	Designing interfaces and flows that stay simple and intuitive for real users

FEATURED PROJECTS

KuExpo — AI-powered B2B2C fair & event management SaaS. Free for organizers, usage-based pricing for exhibiting companies.

The Bug — Automated code-audit agent for developers; surfaces proof-backed, verified findings instead of guesses.

LifeCheck Mobility — Mobility & emergency-awareness mobile app.

SoberStat — Social drinking & health-awareness mobile app.

myartauthentic — Digital authentication web platform for verifying the authenticity of artworks.

Panther Carry — Human-assisted carrying & concierge service concept for premium environments (malls, airports, events).

Cenova Media — In-elevator advertising network for prestigious residential and office buildings.

AI Chatbot — Next.js-based chat application built to prototype LLM integrations.

Additional client projects are covered under NDA and available to discuss on request.
